Keywords: intrauterine devices

Abstract: The article presents a case study of a 38-year-old woman suffering from protracted abdominal pain. Laboratory findings revealed that the patient had normocytic normochromic anaemia. It discusses the diagnosis of ovarian actinomycosis and treatment of the patient with parenteral penicillin. It also mentions that suppression of the immune response by drugs or radiation, immunosuppression is a major cause for actinomycosis condition and elevated alkaline phosphatase acts as its indicator.
